

ABSTRACT

To provide a resin composition comprising a polypropylene
5 resin composition and an aluminum flake pigment for use as an
automotive resin composition, which is excellent in mechanical
strength, physical properties and flowability, and enables to
produce molded products showing good metallic appearance.

A composition comprising a crystalline propylene/ethylene
10 block copolymer, an elastomeric polymer and an inorganic filler
is a preferred example of the polypropylene resin composition,
and aluminum flakes surface-coated with a polymer containing as
constituent units acrylic acid, an acrylic acid ester, epoxylated
polybutadiene and divinylbenzene are preferred examples of the
15 aluminum flake pigment.
